Introduction

Welcome to the CozyCommerce documentation! 🎉

This guide will walk you through everything you need to know to launch, manage, and scale your Next.js eCommerce store using **CozyCommerce** — a Complete Full-Stack Next.js, low-code boilerplate powered by the latest web technologies. Whether you're launching a single brand store or building SaaS-level eCommerce platforms, CozyCommerce gives you the flexibility and power to do it right.

What is CozyCommerce?

CozyCommerce is a Full-Stack Next.js, Complete eCommerce solution built with **Next.js**, **Tailwind CSS**, **Shadcn UI**, and **Prisma 5**. It includes everything you need to create dynamic, high-performance online stores — from a beautifully designed storefront to a fully functional admin dashboard.

CozyCommerce is ideal for developers, startups, and digital agencies who want complete control over their store infrastructure with a modern codebase, built-in integrations, and seamless deployment.

Why Choose CozyCommerce?

CozyCommerce stands out by being:

- **Low-Code & Developer-Friendly** – Easily customizable with reusable components, while staying flexible for advanced dev work.
- **Fully Self-Hostable** – You own your code, database, and deployment. No vendor lock-in.
- **Beautifully Designed** – Comes with pre-built pages and templates for fashion, digital products, and more.
- **Modern Tech Stack** – Powered by Next.js, Tailwind CSS, Shadcn UI, Prisma, NextAuth, and more.
- **End-to-End Ready** – From storefront to CMS to payment processing, everything is included.

Key Features - A Complete eCommerce Solution for Next.js

- ⚙️ **Custom Admin Dashboard** – Manage products, orders, SEO settings, and blog posts with a powerful and intuitive backend.
- 🧩 **Pre-Built Templates & Pages** – Launch quickly using included pages for home, product, category, cart, checkout, and more.
- 🔍 **Built-In Search with Algolia** – Lightning-fast search experience for users.
- 💳 **Stripe Payments Integration** – Secure, seamless checkout with Stripe.
- ✍️ **Content Management System** – Built-in headless CMS for managing product content and blogging.
- 🚀 **One-Click Deployment** – Deploy easily with Vercel or any platform of your choice.

- 📱 **Fully Responsive** – Works perfectly across all screen sizes and devices.
- 🔐 **Authentication & Access Control** – User management with NextAuth for customers and admin users.
- 📈 **SEO-Optimized** – Boost organic reach with built-in blog and structured metadata.
- ♾️ **Scalable Architecture** – Flexible enough to grow from a small store to a full SaaS platform.

Explore the sidebar to dive into installation, configuration, features, deployment, and customization instructions.

Need help or want to share feedback? Reach out to our team via support ticket — we're here to support your success!

Installation

Welcome to **CozyCommerce** — the modern, scalable, developer-first eCommerce solution built with Next.js. This guide will help you get up and running quickly, whether you're setting up a local development environment or preparing for production deployment.

✅ What You'll Need

To set up CozyCommerce, make sure you have the following tools installed:

- **Node.js** (version 19.0.0 or newer)
- **npm** (version 10.0.0 or newer)
- **Git** for version control

Using a version manager like nvm is highly recommended for Node.js.

🔧 Configuration Overview

Before running CozyCommerce, you'll need to configure your environment. Create a .env file in the root of the project and include all required credentials and API keys. These variables are essential for connecting to services like the database, email provider, image hosting, and more.

Key settings include:

- API keys for Stripe, Cloudinary, Algolia
- OAuth credentials (GitHub, Google)
- SMTP settings (Resend)
- Database connection string
- NextAuth secrets
- App URLs

⚠️ Always keep this file private and never upload it to a public repository.

🛠️ Local Setup Instructions

1. **Install all dependencies** using:
2. `npm install`
3. **Initialize Prisma** for database interactions:
4. `npx prisma generate`
5. **Start your local server**:
6. `npm run dev`

You can now preview your site at http://localhost:3000.

🚀 Deploying to Production (Vercel)

CozyCommerce is fully compatible with Vercel, making it easy to go live:

1. Push your project to GitHub or another Git provider.
2. Sign in to Vercel and import your repository.
3. Configure all environment variables through the dashboard.
4. Select **Next.js** as your framework.
5. Click **Deploy** and let Vercel handle the rest.

Want to connect a custom domain? Vercel supports domain configuration out of the box.

🔗 Integrations & Services

CozyCommerce integrates with top-tier platforms to power your storefront:

- **Neon** — Cloud-native PostgreSQL database.
- **Cloudinary** — Media storage and optimization.
- **Stripe** — Payments and subscriptions.
- **Algolia** — Lightning-fast search solutions.
- **Resend** — Developer-first email API.
- **Formbold** — Backend for handling form submissions.
- **OAuth Providers**: Set up GitHub and Google for social login support.

📖 Explore More

Visit our documentation for in-depth guides on every major feature:

- Database Integration
- Authentication
- Payment Gateways
- Algolia - AI-Powered Search
- Cloudinary - Image Hosting
- Email - Transactional/SMTP
- Admin Access

Database Integration

For email Authentication we used a Database with Prisma ORM.

In this part of the documentation we are going to show you how to integrate a database on your boilerplate template.

We will show you how to integrate Vercel PostgreSQL if you want to use other providers you can do so.

- PostgreSQL on Vercel

Other Providers

- Neon
- Supabase
- Xata

Follow the providers documentation and generate the Database URL and update the env variable.

```
DATABASE_URL="YOUR_DB_URL"
```

After that Migrate the Schema

PostgreSQL Integration

Our boilerplate comes with PostgreSQL integration using Neon, a serverless Postgres solution. It makes it easy to set up a database for your e-commerce store with minimal configuration and cost-effective pricing.

In this section, we will guide you through how to integrate Neon PostgreSQL with the boilerplate template.

Note: If you want to use other providers you can do so. For demonstration purposes, we are using Neon PostgreSQL

Getting Started with Neon

1. First, visit Neon's website and sign up for a free account.
2. After signing up and logging in, you'll see the project creation form with the following options:
   - Project Name: Choose a name for your project
   - PostgreSQL Version: Select your preferred version
   - Region: Choose between AWS or Azure (AWS is selected by default)
   - For AWS, you can select specific regions like:
     - Asia Pacific (Singapore)
     - US East (N. Virginia)
     - EU West (Ireland)
     - And more...
3. Click "Create Project" to set up your database.

Getting the Database URL

Once your project is created, you'll be taken to the Neon dashboard:

1. Look for the "Connect" button in your project dashboard
2. You'll see your connection string in this format:

```
postgres://[user]:[password]@[endpoint]/[dbname]
```

1. Copy the connection string and add it to your .env file as:

```
DATABASE_URL=your_connection_string_here
```

Key Benefits of Using Neon PostgreSQL

- **Serverless Architecture:** Neon's serverless architecture automatically scales based on your needs, ensuring optimal performance.
- **Branching:** Create database branches for development, testing, and production environments.
- **Cost-effective:** Start with the free tier and pay only for what you use beyond the free limits.

- **Data Security:** Neon provides enterprise-grade security with encryption at rest and in transit.
- **Advanced Querying:** Full support for PostgreSQL features including complex queries, full-text search, and JSON data types.
- **Performance Optimization:** Built-in connection pooling and query optimization for better performance.

Pro tip: Use Neon's connection pooling for better performance and resource utilization. The connection string includes a pooled connection option by default.

Environment Setup

After getting your database URL, you need to add it to your environment variables:

1. Create a .env file in your project root if you haven't already
2. Add your Neon database URL:

```
DATABASE_URL=your_neon_connection_string
```

Migrate the Schema

Welcome to the next section of CozyCommerce documentation, to migrate the schema. After generating the database URL, you have to migrate the schema to your database. It easily ensures that your database structure aligns perfectly with your e-commerce project.

Schema migration helps you create the necessary tables, columns, and relationships in your database. It helps to make your store functional and maintain consistency.

Follow the instructions below to complete the migration.

Run this command to push the schema to your database.

`npx prisma db push`

After you run this you'll be able to see the **Tables** your Database dashboard

Now run this command

`npx prisma generate`

Now go ahead and signup using the Form. If everything was done properly you'll see the user on the Database.

Notes: Make sure you run Prisma generate command before the final build

`prisma generate`

then

`npm run build`

Also, while deploying your app on Vercel, edit build command and make it like the screenshot below:

Frequently Asked Questions

- **How can I optimize migrations for large databases?**

For large databases, you can break the migration process into smaller batches. It will help you avoid running complex operations at the peak time of traffic. In addition to that, you can use the indexed columns to speed up the operations. Always test the migrations into the staging environment before applying them to the applications.

- **Can migrations affect my application performance?**

Yes, migrating the schema can affect your performance sometimes. However, if you are migrating smaller datasets, it often does not hamper your performance or experience. The

best practice is to run migrations during the off-time.

- **How do I handle schema migrations with zero downtime?**

To implement the zero downtime schema migrations, you can use the non-breaking schema changes. You can add new columns and indexes so as not to hamper the application's performance. After that, you can gradually shift the applications to the new schema to minimize the impacts on running time or performance.

For larger databases, make small and non-breaking changes first. Migrate to the new schema gradually to reduce the downtime issues.

Migrate the Schema

Welcome to the next section of CozyCommerce documentation, to migrate the schema. After generating the database URL, you have to migrate the schema to your database. It easily ensures that your database structure aligns perfectly with your e-commerce project.

Schema migration helps you create the necessary tables, columns, and relationships in your database. It helps to make your store functional and maintain consistency.

Follow the instructions below to complete the migration.

Run this command to push the schema to your database.

```
npx prisma db push
```

After you run this you'll be able to see the **Tables** your Database dashboard

Now run this command

```
npx prisma generate
```

Now go ahead and signup using the Form. If everything was done properly you'll see the user on the Database.

Notes: Make sure you run Prisma generate command before the final build

```
prisma generate
```

then

```
npm run build
```

Also, while deploying your app on Vercel, edit build command and make it like the screenshot below:

Frequently Asked Questions

- **How can I optimize migrations for large databases?**

For large databases, you can break the migration process into smaller batches. It will help you avoid running complex operations at the peak time of traffic. In addition to that, you can use the indexed columns to speed up the operations. Always test the migrations into the staging environment before applying them to the applications.

- **Can migrations affect my application performance?**

Yes, migrating the schema can affect your performance sometimes. However, if you are migrating smaller datasets, it often does not hamper your performance or experience. The best practice is to run migrations during the off-time.

- **How do I handle schema migrations with zero downtime?**

To implement the zero downtime schema migrations, you can use the non-breaking schema changes. You can add new columns and indexes so as not to hamper the application's performance. After that, you can gradually shift the applications to the new schema to minimize the impacts on running time or performance.

For larger databases, make small and non-breaking changes first. Migrate to the new schema gradually to reduce the downtime issues.

Import Demo Data

This guide will help you import demo data into your Neon PostgreSQL database using Prisma. The demo data helps you get started with CozyCommerce.

Prerequisites

Before importing the demo data, make sure you have:

1. Set up your Neon PostgreSQL database
2. Configured your .env file with the DATABASE_URL
3. Installed all project dependencies

Installation

First, install the required dependencies:

```
npm install @prisma/clientnpm install prisma --save-dev
```

Database Setup

1. Initialize Prisma in your project (if not already done):

```
npx prisma init
```

1. Generate the Prisma client:

```
npx prisma generate
```

1. Create and apply the database migrations:

```
npx prisma migrate dev
```

Importing Demo Data

We've provided a script to import demo data into your database.

To run the import script:

```
npm run import-demo-data
```

Warning: This script will delete all existing data in your database before importing the demo data. Make sure to backup your data if needed.

Authentication

In this part of the documentation we are going to show you how to configure NextAuth and enable Authentication.

First setup Database & NextAuth then follow any of the method you want:

- Google Authentication
- Github Authentication

Note: We only showed you how to integrate Google and GitHub authentication. If you want, you can integrate other providers too. Checkout the NextAuth documentation for more information.

NextAuth Setup

Welcome to the NextAuth setup section of CozyCommerce documentation. It offers a very simple way to add secure authentication to your e-commerce store. In this part, we will guide you through the step-by-step process of integrating NextAuth.js into your store. So, you can provide a simple, secure, and customizable authentication for your users.

NextAuth integration ensures a smooth user experience with powerful security features. Together with that, you can offer a variety of authentication methods like social login and custom credentials.

Setting Up NextAuth for Your Project

Before integrating Github and Google authentication, you must set up NextAuth for your project. And to set up the NextAuth, create a .env file in the root of your project first.

Then add NextAuth_SECRET and NextAuth_CLIENT to the **.env** file.

`NEXTAUTH_SECRET=SECRET_KEYNEXTAUTH_URL=http://localhost:3000`

NEXTAUTH_SECRET is just a random string. You can generate a random string using this command

`openssl rand -base64 32`

or you can go to this URL it'll give you a unique string too.

The NEXTAUTH_URL for development is http://localhost:3000 and for deployment it's the canonical URL of your site.

FAQs

- **How do I configure NextAuth in CozyCommerce?**

To configure the NextAuth into your CozyCommerce template, you have to install next-auth using npm or yarn. Then you have to create an API route in /page/api/authentication/[...nextauth] and configure the providers and callback options. However, ensure the environment variables like NEXTAUTH_SECRET

Google Login

In this part of the documentation, we are going to show you how you can integrate Google Authentication into the CozyCommerce.

To integrate Google Authentication you have to create a project on Google Console. Then you have to get the Secret and Client Key.

Follow these steps to create a project on Google Console, after that get the Secret and Client ID.

Getting The Google Secret and Client ID

To get the Google Secret go to **Google Console.** If you already have projects you'll see **CREATE CREDENTIALS** button at the top, from there you can generate the Secret and Client ID.

If you don't have a project already then create one.

1. Create a Project: Go to the Projects tab, you'll see all the projects there.
2. After that click on the **New Project** button as shown below, then follow the steps to create a new project.
3. Once you've created the project make sure to select it.
4. Now create the credentials by clicking on the **CREATE CREDENTIALS** and then the **0Auth client id.**
5. Once you click on the **0Auth client ID** you might see something like this. If you see this, go ahead and configure the consent screen.
6. Once it's done click on the **0Auth client ID** once again and follow the steps to set it up
7. You'll be asked to provide the **Authorized JavaScript Origin.** Click on the **ADD URI** button to add it.

Since we are setting up a local environment, we are going to add our localhost URI there.

1. After that, you have to provide the **Authorized redirects URI.** For the **Authorized redirects URI** you have to include your domain with the callback path included in the end.

For production: https://{YOUR_DOMAIN}/api/auth/callback/google

For development: http://localhost:3000/api/auth/callback/google

1. Once the setup is done click on the **Create** button, if everything is done perfectly you'll be redirected to this page.

Here you can see the **Client ID** and **Client Secret** go ahead and copy-paste them to the .env file

The .env variables will look like this:

`GOOGLE_CLIENT_ID=YOUR_GOOGLE_CLIENTGOOGLE_CLIENT_SECRET=YOUR_GOOGLE_SECRET`

If you've accidentally closed the tab, click on this button to open it again.

GitHub Login

In this part of the documentation, we are going to show you how you can integrate GitHub Authentication on your CozyCommerce.

To integrate Github Authentication you have to create a OAuth app on GitHub. Then you have to get the Client ID and Secret.

Follow the steps below to create a OAuth account on GitHub and then get the keys.

Getting The Github Secret and Client ID

To generate the Github Secret and Client ID first, you have to create a OAuth Application on Github.

1. Go to your GitHub account then navigate to the Developer Settings
2. Click on the **OAuth App** button then click on the **Register a new application** button to register an Application.
3. Register an App by providing all the information.
4. Remember to change the **Authorization Callback URL** for the production. Just change the **http://localhost:3000** part of the URL with the URL of your website.
5. Generate the Client's Secret: Click on the **Generate a new client secret** button to generate the Secret.
6. Now Copy the Client ID and Client Secret from here.
7. Now, add those keys to your .env file to the following variables

```
GITHUB_CLIENT_ID=PASTE_YOUR_CLIENT_ID_HEREGITHUB_CLIENT_SECRET=PASTE_YOUR_CLIENT_SECRET_HERE
```

Stripe Integration

Welcome to the stripe integration of CozyCommerce documentation. In this section, we will guide you on how to integrate Stripe, set up payment methods, manage transactions, and enable secure checkout.

Stripe is a powerful and flexible payment solution. So, you can manage subscriptions and accept payments smoothly. It provides a safe, secure, and user-friendly experience for your e-commerce store.

- Getting the stripe secret key

Getting the Stripe Secret Key

To get the Stripe secret key you have to have a Stripe account. If you don't have one go ahead and create it.

For this integration, we are using the Test Mode. Before you deploy your site, make sure to Activate your Stripe account and integrate it with a real Secret Key.

1. Go to the **Developers** tab.
2. Then go to the **API Keys** tab, after that scroll down to the **Secret Key** and copy it.

Now add it to the .env file.

```
STRIPE_SECRET_KEY=YOUR_STRIPE_SECRET_KEY
```

Algolia

In this part of the documentation, we will show you how to integrate Algolia into your CozyCommerce.

Overview

Integrating Algolia into your CozyCommerce will enhance your application's search functionality, providing your users with fast and relevant search results.

Follow the steps below to integrate Algolia:

Step-by-Step Guide

1. **Create an Algolia Account**
   Log in to your Algolia dashboard. If you don't have an account, go ahead and create one.
2. **Create a project**
   Go to the dashboard, click on **Application** and, then click on the **Create Application** button. Follow the steps to create the application.
3. ***Note***
   It'll create an unnamed application. If you prefer to change the name go to: Settings>Applications.
4. After creating the application you'll be redirected to a page for importing data.
5. For now click on **Skip for now**, you can import data or use the crawler of Alogolia to extract data from your site later on.
6. **Project ID & API Key**
7. These values are for the below environment variables
8. `NEXT_PUBLIC_ALGOLIA_PROJECT_ID=NEXT_PUBLIC_ALGOLIA_WRITE_API_KEY=`
9. Alternatively, if you do not see this section below on the Overview page. You can go to your account settings>Applications
10. You'll see a list of all the application you created. Click on the application you want to use for this project.
11. Now you'll be redirected to this page. Click on **API Keys**
12. Now copy the **Application ID** and **Write API Key** and store it in your environment variables
13. **Create an Index Name**
14. From the Overview page click on **Data sources**
15. Now from the **Indices** tab click on **Create Index**
16. A modal will open, enter your preferred Index name.
17. A rule of thumb we suggest for naming the index: *Describes what it stores*. So your name will reflect the data Algolia will store on that index name. Additionally prefix the name with the environment you'll be using it in(e.g development, production).
18. Now click on **Create**.
19. Store this index name in your env. You'll find a variable NEXT_PUBLIC_ALGOLIA_INDEX

By following these steps, you can successfully integrate Algolia into your SaaSBold boilerplate, providing an efficient search experience for your users.

Cloudinary Integration

CozyCommerce uses Cloudinary for efficient image management, optimization, and delivery. This guide will help you set up Cloudinary in your store.

Overview

Cloudinary provides:

- Image upload and storage
- Automatic image optimization
- Responsive images
- Image transformations
- CDN delivery

Step-by-Step Setup

1. Create a Cloudinary Account

1. Visit Cloudinary's website and sign up for a free account

2. Get Your API Credentials

After signing up, you will see a 'View API Key' button. Click it to copy the values. If you have already signed up, log in and navigate to Home > Dashboard to view your API key and other details.

1. Go to your **Dashboard**
2. look for the **Account Details** section
3. Copy these values for your environment variables:

```
NEXT_PUBLIC_CLOUDINARY_CLOUD_NAME="your_cloud_name"CLOUDINARY_API_KEY="your_api_key"CLOUDINARY_API_SECRET="your_api_secret"
```

Keep your API Secret secure and never expose it in client-side code. Only use it in server-side operations.

Remember to regularly check your Cloudinary dashboard for usage statistics and potential issues.

Resend Integration

Welcome to the Resend integration of Cozycommerce documentation. In this guide, we will share how to integrate Resend and SMTP with your e-commerce store. It allows you to send transactional e-mails from your website.

Resend is a simple yet powerful option for sending and managing transactional and marketing e-mails from your store. It provides a reliable e-mail delivery of order confirmations, password reset, or promotional campaigns. Also, you can easily customize the templates and enhance user engagement.

Follow the steps below to integrate SMTP in your boilerplate template:

Note: We will be using **Resend** as our SMTP provider. You can use any SMTP provider you want.

1. Login to **Resend** if you don't have an account already go ahead and create one.
2. **Generate API Key:** Go to **API Keys** and click on the **Create API Key** button
3. Get the SMTP **PORT** and **HOST:** Go to **Settings** then go to **SMTP** you can see all of them here.

Go ahead and copy these and then update the env file

EMAIL_SERVER_HOST=YOUR_SMTP_HOSTEMAIL_SERVER_PORT=YOUR_SMTP_PORTEMAIL_SERVER_USER=YOUR_SMTP_USEREMAIL_SERVER_PASSWORD=YOUR_SMTP_PASSWORD(for resend it's the API KEY)EMAIL_FROM=YOUR_EMAIL_TO_SEND_FROM

One last thing you have to do is verify your Domain.

FAQs

- **Can I use Resend with serverless functions in Next.js?**

Yes, Resend works smoothly with the serverless functions in Next.js. First, you have to create an API route in your application. Then import the Resend client and call the Resend API with the route handler. In this way, you can easily send transactional and promotional e-mails directly from your Next.js serverless functions.

- **How can I manage multiple email templates in Cozycommerce?**

You can simply organize the e-mail templates by action types. In Cozycommerce, you can use Resend's template ID to dynamically find the right template with the API call. It allows you to keep your e-mail communication scalable and efficient. Together with that, you can easily manage and organize your templates for each task.

- **Can I log email events for analytics purposes?**

Yes, you effortlessly log into e-mail events for analytics with Cozycommerce. With the integration of Resend Webhooks, Cozycommerce allows you to check the e-mail analytics. Configure and set up the webhooks to capture e-mail opens, clicks, and bounces. It will store the data in the database and help you to track user engagements.

Admin Access

Welcome to the admin access section of CozyCommerce documentation. Here we will show you how to set up and manage the administrative access of your e-commerce store. Proper admin management is always important for an e-commerce store. It secures your store and ensures that only authorized personnel have access to sensitive information and operations.

CozyCommerce provides the best security for your and your user's information. We ensure that only authorized admins have control over all and have a well-organized system. If you are not an admin you will not be able to access the admin panel.

Setting Up the Admin Access

First, you have to enable admin access in CozyCommerce. Follow the steps to enable the admin access:

1. To give yourself admin privilege add your email to the ADMIN_EMAILS .env variable before registering with that email.

ADMIN_EMAILS=youremail@gmail.com

1. You can also assign roles based on your needs. You can define the role-based permissions for product management, processing, and analytics.
2. If you want to add other users as admin, you can add their emails as a comma-separated list.

ADMIN_EMAILS=youremail@gmail.com,sam@gmail.com,jhon@gmail.com

This will set the role to ADMIN for these users.

Securing Admin Access

CozyCommerce allows you to easily secure admin access. Securing your admin access is always crucial for e-commerce. Here are some security practices that you must follow:

1. Use strong passwords and two-factor authentication for admin accounts. It adds another layer of security to your store.
2. Always monitor the admin logs for better accountability. Log auditing helps you to track who accessed the information and data.

Troubleshooting Admin Issues

CozyCommerce not only offers easy and safe access but also helps you to avoid any issues. However, if you face any issues you can effortlessly solve them with simple steps.

1. If any admin faces access-denied issues, check the roles and permissions first. Verify their role setting to solve the problem.

2. An admin can be locked out for various failed login attempts. Ensure that they have a backup authentication like two-factor authentication or e-mail verification.

To maintain safety and security review roles and access regularly and track the audit log.

If you face any other issues, just submit a support ticket and our team will reach out to you as soon as possible.
